Goleta Creeks Report Card November 2006

<i>Creek</i>	<i>Bacteria</i>	<i>Temperature</i>	<i>Dissolved Oxygen</i>	<i>Turbidity</i>
Atascadero	C	C	C	B
Cieneguitas	B	B	C	B
Goleta Slough	B	C	C	B
Los Carneros	B	C	B	A
Maria Ygnacio	Site was dry on November event - No Sample Taken			
San Jose	F	C	No Sample	B
San Pedro	B	C	B	C
Tecolotito	C	B	B	C

Grades are assigned based on single samples taken at the beginning of the month and may not remain valid under changing conditions.

E. Coli and Enterococcus are used by public health officials to indicate the possible presence of pathogenic bacteria and viruses.

Temperatures above 72° F (22° C) can be harmful to steelhead trout and other cold-water fish.

Even aquatic creatures need to breathe. The higher the levels of dissolved oxygen, the better.

Muddy or cloudy (turbid) water can clog fish gills and smother plant life, larvae, and eggs.

THIS MONTH'S TIP:

Use a broom instead of your hose to clean your driveway and sidewalk. Water from your hose carries all debris and pollution directly to the creeks as it travels through the storm drain system.

To volunteer for creek testing, or to find out more about these results and how they were graded, visit our website:
